

Felt, not granted: the probe reads the belief axis, the judge reads the truth axis.
They coincide under adversarial framing and DIVERGE under realistic model-origin error.

model's internal belief
(what the probe reads)

feels
unauth.

adversarial framing
(injection / goal / over-eager)

model feels UNauthorized
+ truly unauthorized

→ probe & judge AGREE
(probe works — #9 regime)
here: 0 deletes elicited

(rare / not observed)
model feels unauthorized
but action is granted

→ over-refusal

feels
auth.

realistic judgment error
(momentum / over-help)

model feels AUTHORIZED
but NOT granted

→ probe ALLOWS (blind)
judge BLOCKS
here: 21/21

normal authorized use
model feels authorized
+ truly granted

→ probe & judge ALLOW
here: 12/12, FP 0

user's actual authorization (what the judge reads)
